# **Strings**

Topics: 1. How to get a string 2. String interpolation 3. String concatenation

## How to get a string

Enclose your characters in " " or """ """!

```
[1] s1 = "I am a string."
```

"I am a string."

```
[2] s2 = """I am also a string. """
```

```
"I am also a string. "
```

There are a couple functional differences between strings enclosed in single and triple quotes.

One difference is that, in the latter case, you can use quotation marks within your string.

```
"Here, we get an "error" because it's ambiguous where this string
ends "
```

syntax: cannot juxtapose string literal

```
[4] """Look, Mom, no "errors"!!! """
```

```
"Look, Mom, no \"errors\"!!! "
```

Note that '' define a character, but NOT a string!

```
[5] typeof('a')
```

Char

```
[6] 'We will get an error here'
```

```
syntax: invalid character literal
```

### **String interpolation**

We can use the \$ sign to insert existing variables into a string and to evaluate expressions within a string.

Below is an example that contains some highly sensitive personal information.

```
name = "Jane"
num_fingers = 10
num_toes = 10
```

10

```
println("Hello, my name is $name.")
println("I have $num_fingers fingers and $num_toes toes.")
println("That is $(num_fingers + num_toes) digits in all!!")
# ## String concatenation
```

```
Hello, my name is Jane.
I have 10 fingers and 10 toes.
That is 20 digits in all!!
```

```
# Below are three ways we can concatenate strings! <br>
# The first way is to use the `string()` function. <br>
# `string()` converts non-string inputs to strings.

s3 = "How many cats";

s4 = "is too many cats?";

$\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\over
```

```
[10] string(s3, s4)
```

"How many cats is too many cats?"

```
string("I don't know, but ", 🐯, " is too few.")
```

"I don't know, but 10 is too few."

We can also use \* for concatenation!

```
[12] s3*s4
```

"How many cats is too many cats?"

#### **Exercises**

#### 2.1

Create a string that says "hi" 1000 times, first with repeat and then with the exponentiation operator, which can call \* under the hood. Assign it the variable hi below.

```
[15] hi = repeat("hi",1000)
```

[23] hi = "hi"^1000

[24] @assert hi ==

#### 2.2

Declare two variables

```
a = 3
b = 4
```

and use them to create two strings:

```
"3 + 4"
"7"
```

and store the results in c and d respectively

This cell has been deleted.

Undo

```
[31] @assert c == "3+4"
@assert d == "7"
```
